

Why Multi-Factor Authentication (MFA) is a must

Multi-Factor Authentication (MFA) *adds an extra step* when you log in.

It requires two or more pieces of proof to confirm your identity:

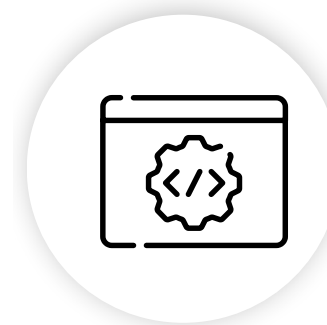

A code sent to your phone

A fingerprint or face scan

or

a security app/key

80%

of hacking-related breaches happen due to weak or stolen passwords.

MFA blocks

99.9%

of automated attacks.

Even if a scammer steals your password, they can't access your account.

Stolen credentials are the

#1

way cyber criminals access business systems.

Businesses without MFA are at higher risk of data breaches and ransomware.

MFA is quick, easy, and it protects your business. Need help getting set up? Get in touch.
